

PARKING TERMINAL

Fixed price payments

PARKING TERMINAL

Fixed price payments

DESCRIPTION

The cost-effective parking terminal with coin selector and cashless card terminal is ideally suited for restricted parking applications with a simple fixed price.

The payment is made at the parking terminal either before entering or exiting the car park. After the complete price is paid, the barrier opens and the car can pass through. An integrated electronic coin validator accepts different coins and tokens, the fixed price can be set locally at the terminal.

In contrast to the EMS-4000 parking system, coin deposits and overpayments cannot be refunded. There is also no parking time dependent tariffing or parking space management available.

OPERATION

The flat rate parking fee is shown on the display. After the complete payment is absolved an output impulse is activated.

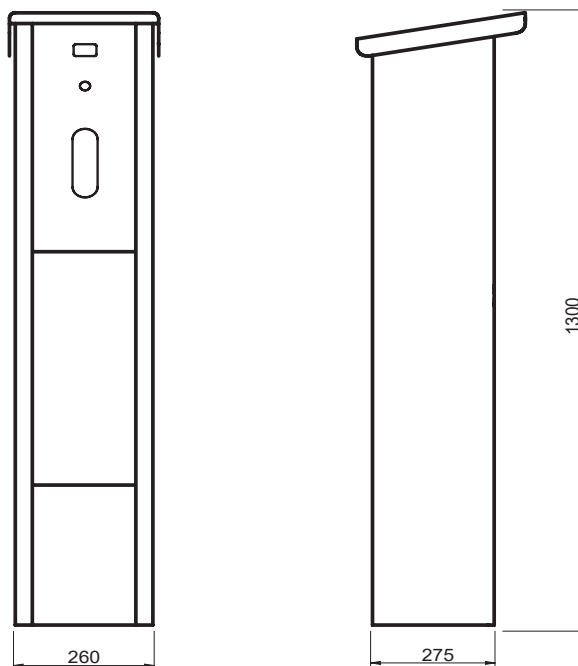

To open a barrier, an external barrier control unit with loop detection is required.

FEATURES

- Robust and weather resistant stainless steel housing
- Elegant design
- Intuitive operation and fast processing
